```

baseline variables, age, sex, body mass index, average blood pressure, and six blood serum measurements were obtained for each of n = 442 diabetes patients, as well as the response of interest, a quantitative measure of disease progression one year after baseline.

Data Set Characteristics:

- Number of Instances: 442
- Number of Attributes: First 10 columns are numeric predictive values
- Target: Column 11 is a quantitative measure of disease progression one year after baseline
- Attribute Information:
 - age age in years
 - sex
 - bmi body mass index
 - bp average blood pressure
 - s1 tc, total serum cholesterol
 - s2 ldl, low-density lipoproteins
 - s3 hdl, high-density lipoproteins
 - s4 tch, total cholesterol / HDL
 - s5 ltg, possibly log of serum triglycerides level
 - s6 glu, blood sugar level

Note: Each of these 10 feature variables have been mean centered and scaled by the standard deviation times $\sqrt{n_samples}$ (i.e. the sum of squares of each column totals 1).
